
CD8−like Progression: are cells later along the same lineage?
Focused comparison: B7H3_vs_41BB−L | Cell−level distributions and cached KS FDRs
L1: cytotoxic effector trajectory
FDR = 7.8e−03
Difference detected
L2: proliferating effector/dysfunction trajectory
FDR = 1.6e−03
Difference detected
L3: exhausted/dysfunctional trajectory
FDR = 0.283
No significant difference

CD28TM.CD28.mutζ
41BBL−CD28TMCD28.mutζ
Rightward = later shared pseudotime. Dashed lines and numbers: pooled cell−weighted means.
The KS test detects any distribution difference, not specifically 'later'.

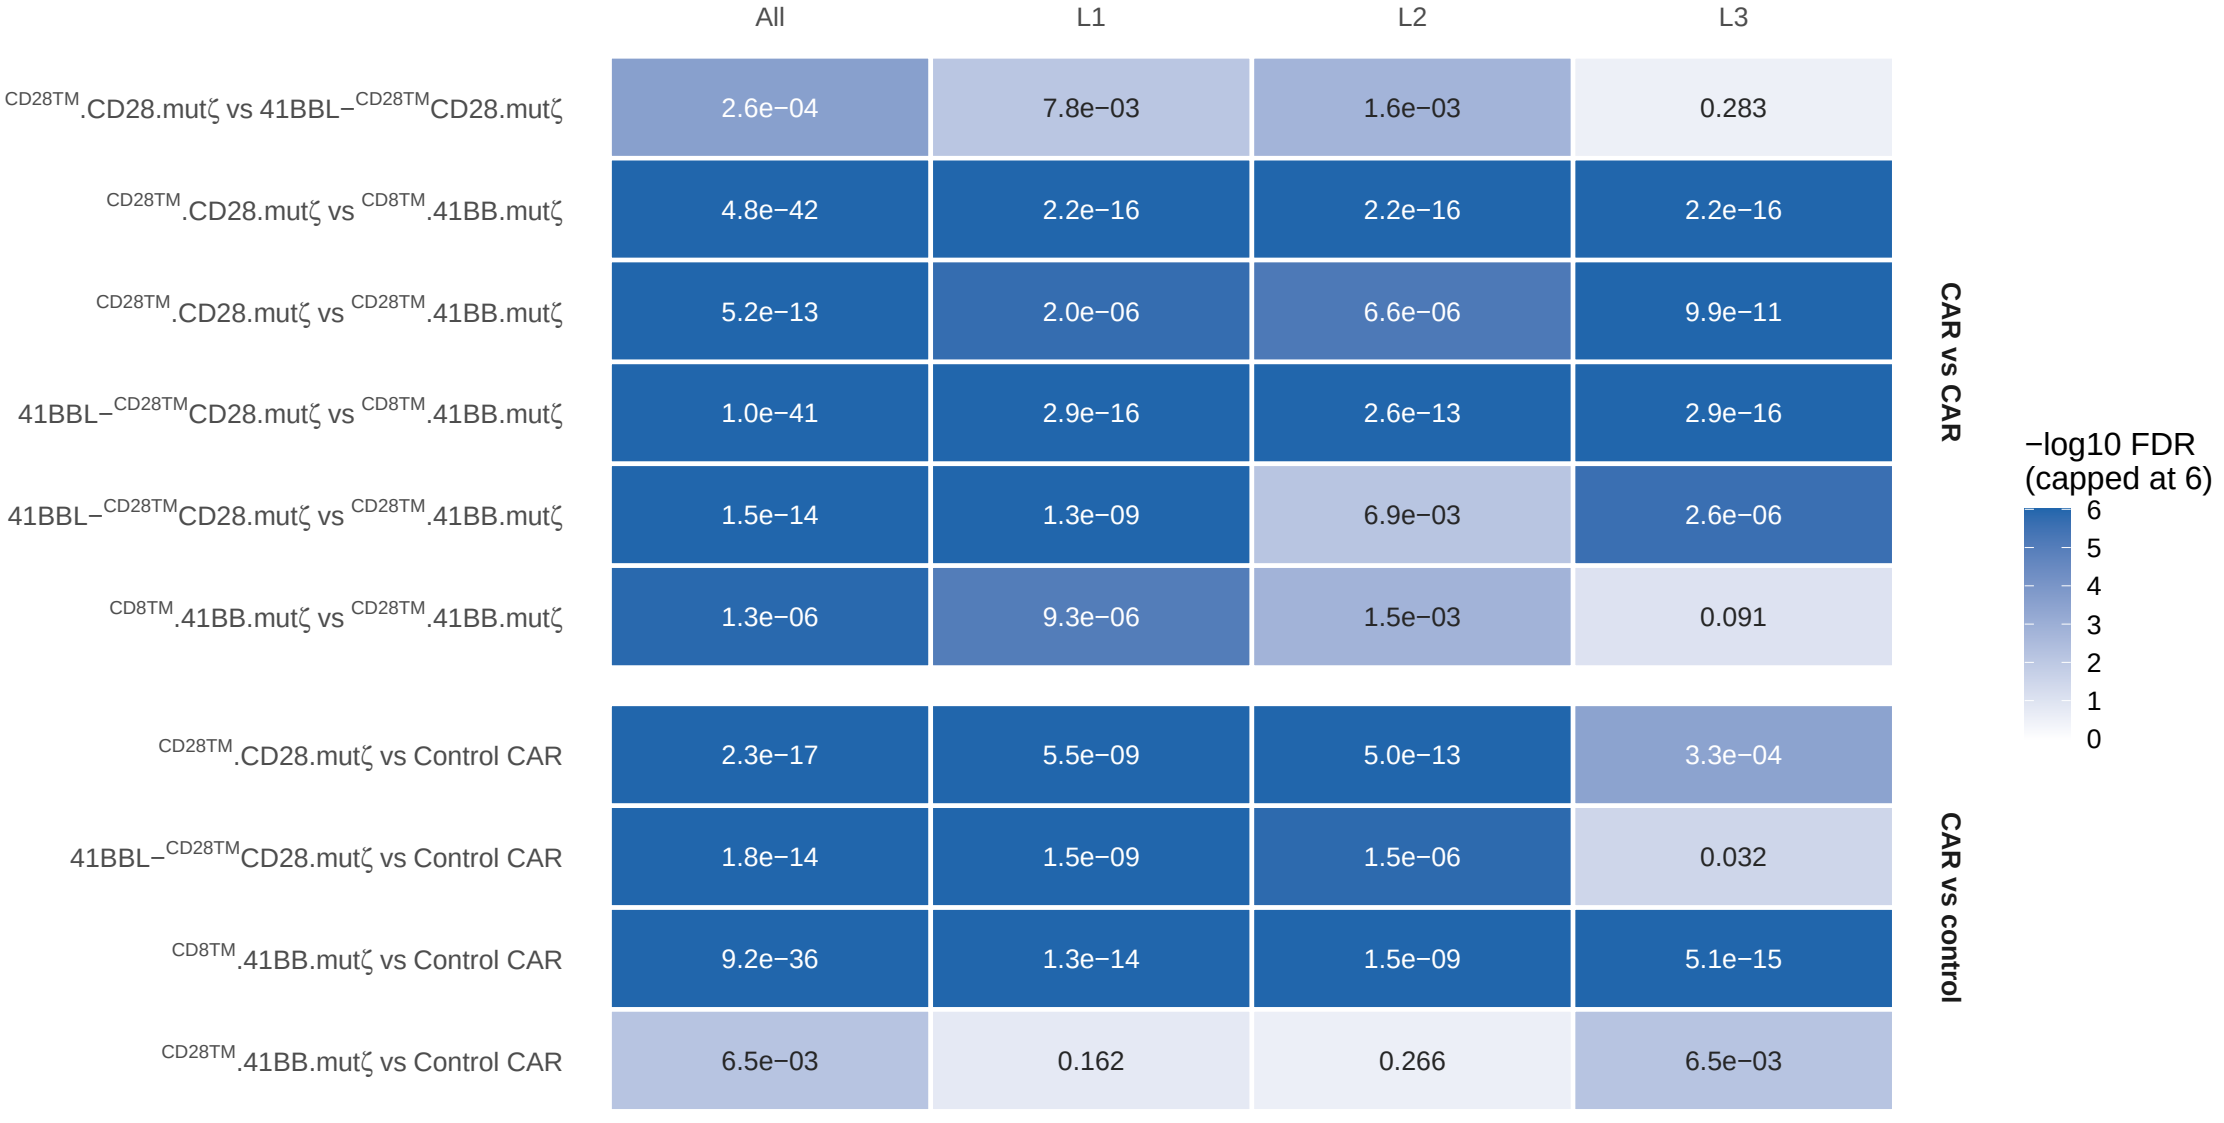

A curve further right (lower) means that construct's cells are further along the lineage.
A curve reaches 100% at that construct's latest cell. Curves that cross have no single direction.
KS FDRs for every pair are in the results TSV (adjusted within each comparison across its four tests).

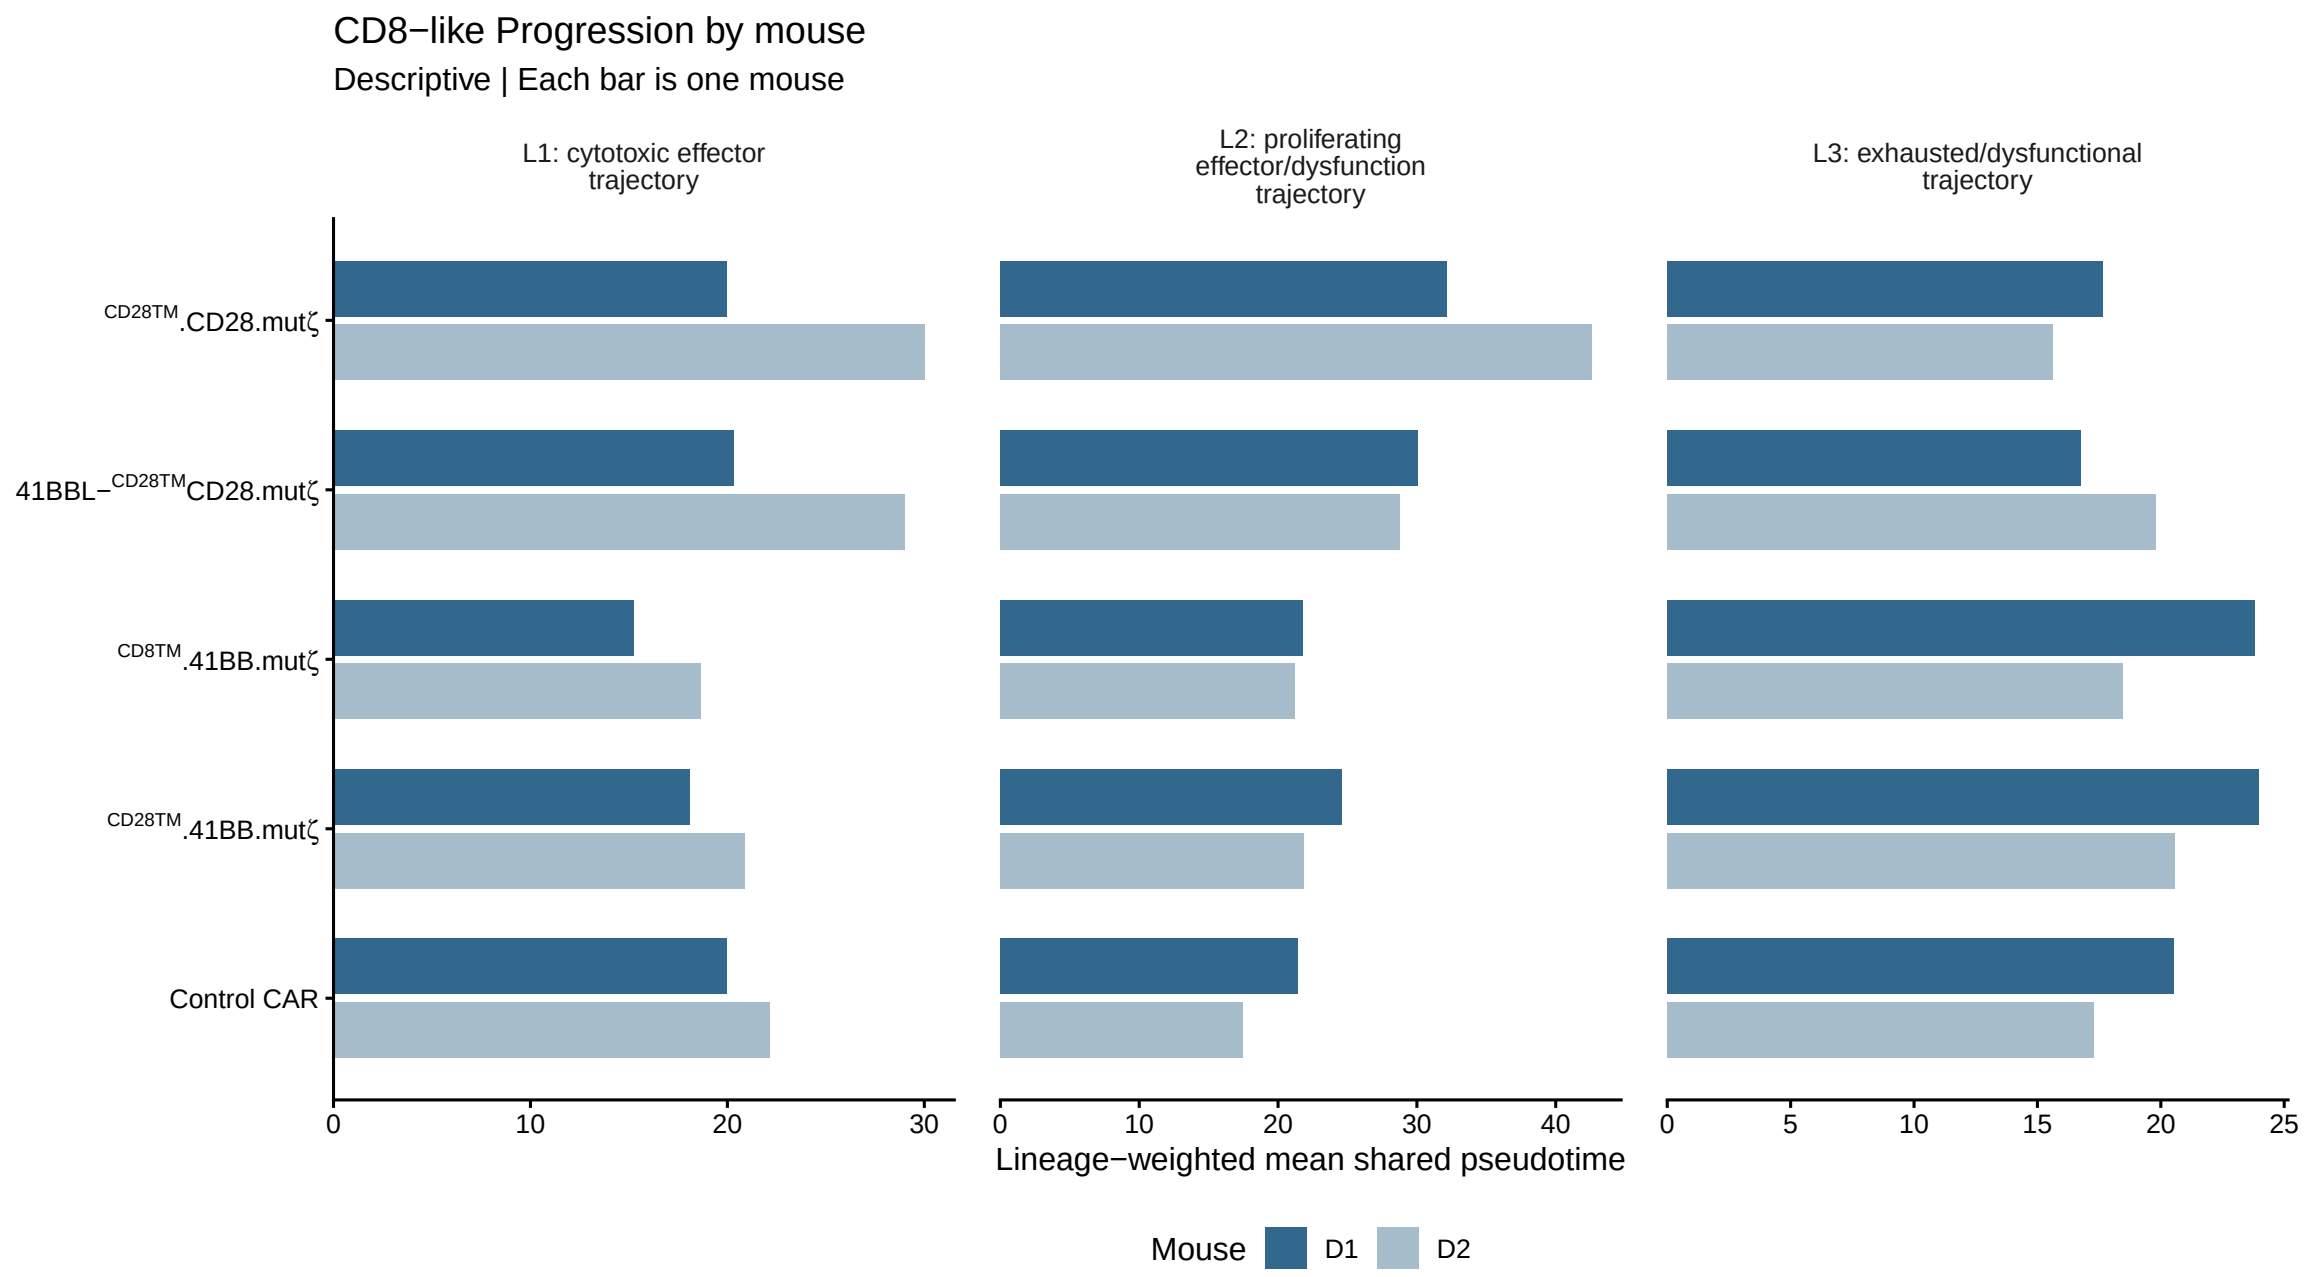

CD8−like Progression: pseudotime distribution by construct
Descriptive | Pooled cells, weighted by lineage membership
L1: cytotoxic effector trajectory
L2: proliferating effector/dysfunction trajectory
L3: exhausted/dysfunctional trajectory
Density (each panel scaled to peak = 1)
Shared pseudotime

41BBL–CD28TMCD28.mutζ
CD8TM.41BB.mutζ
CD28TM.41BB.mutζ
Control CAR
A hump further right means that construct's cells are further along the lineage. Dashed line: weighted mean pseudotime.
Each panel is scaled to a peak of 1: compare hump positions within a column, not heights. X−axes differ between lineages.

CD8−like Progression−test overview

Cell−level test | Two mice per construct

All = global test; L1−L3 = shared lineages. FDR is adjusted within each comparison across its four tests.
L1: cytotoxic effector trajectory; L2: proliferating effector/dysfunction trajectory; L3: exhausted/dysfunctional trajectory

Each bar is one mouse's lineage−weighted mean pseudotime. Compare constructs within one panel; pseudotime scales differ between panels.
