CD4−like Progression: are cells later along the same lineage?

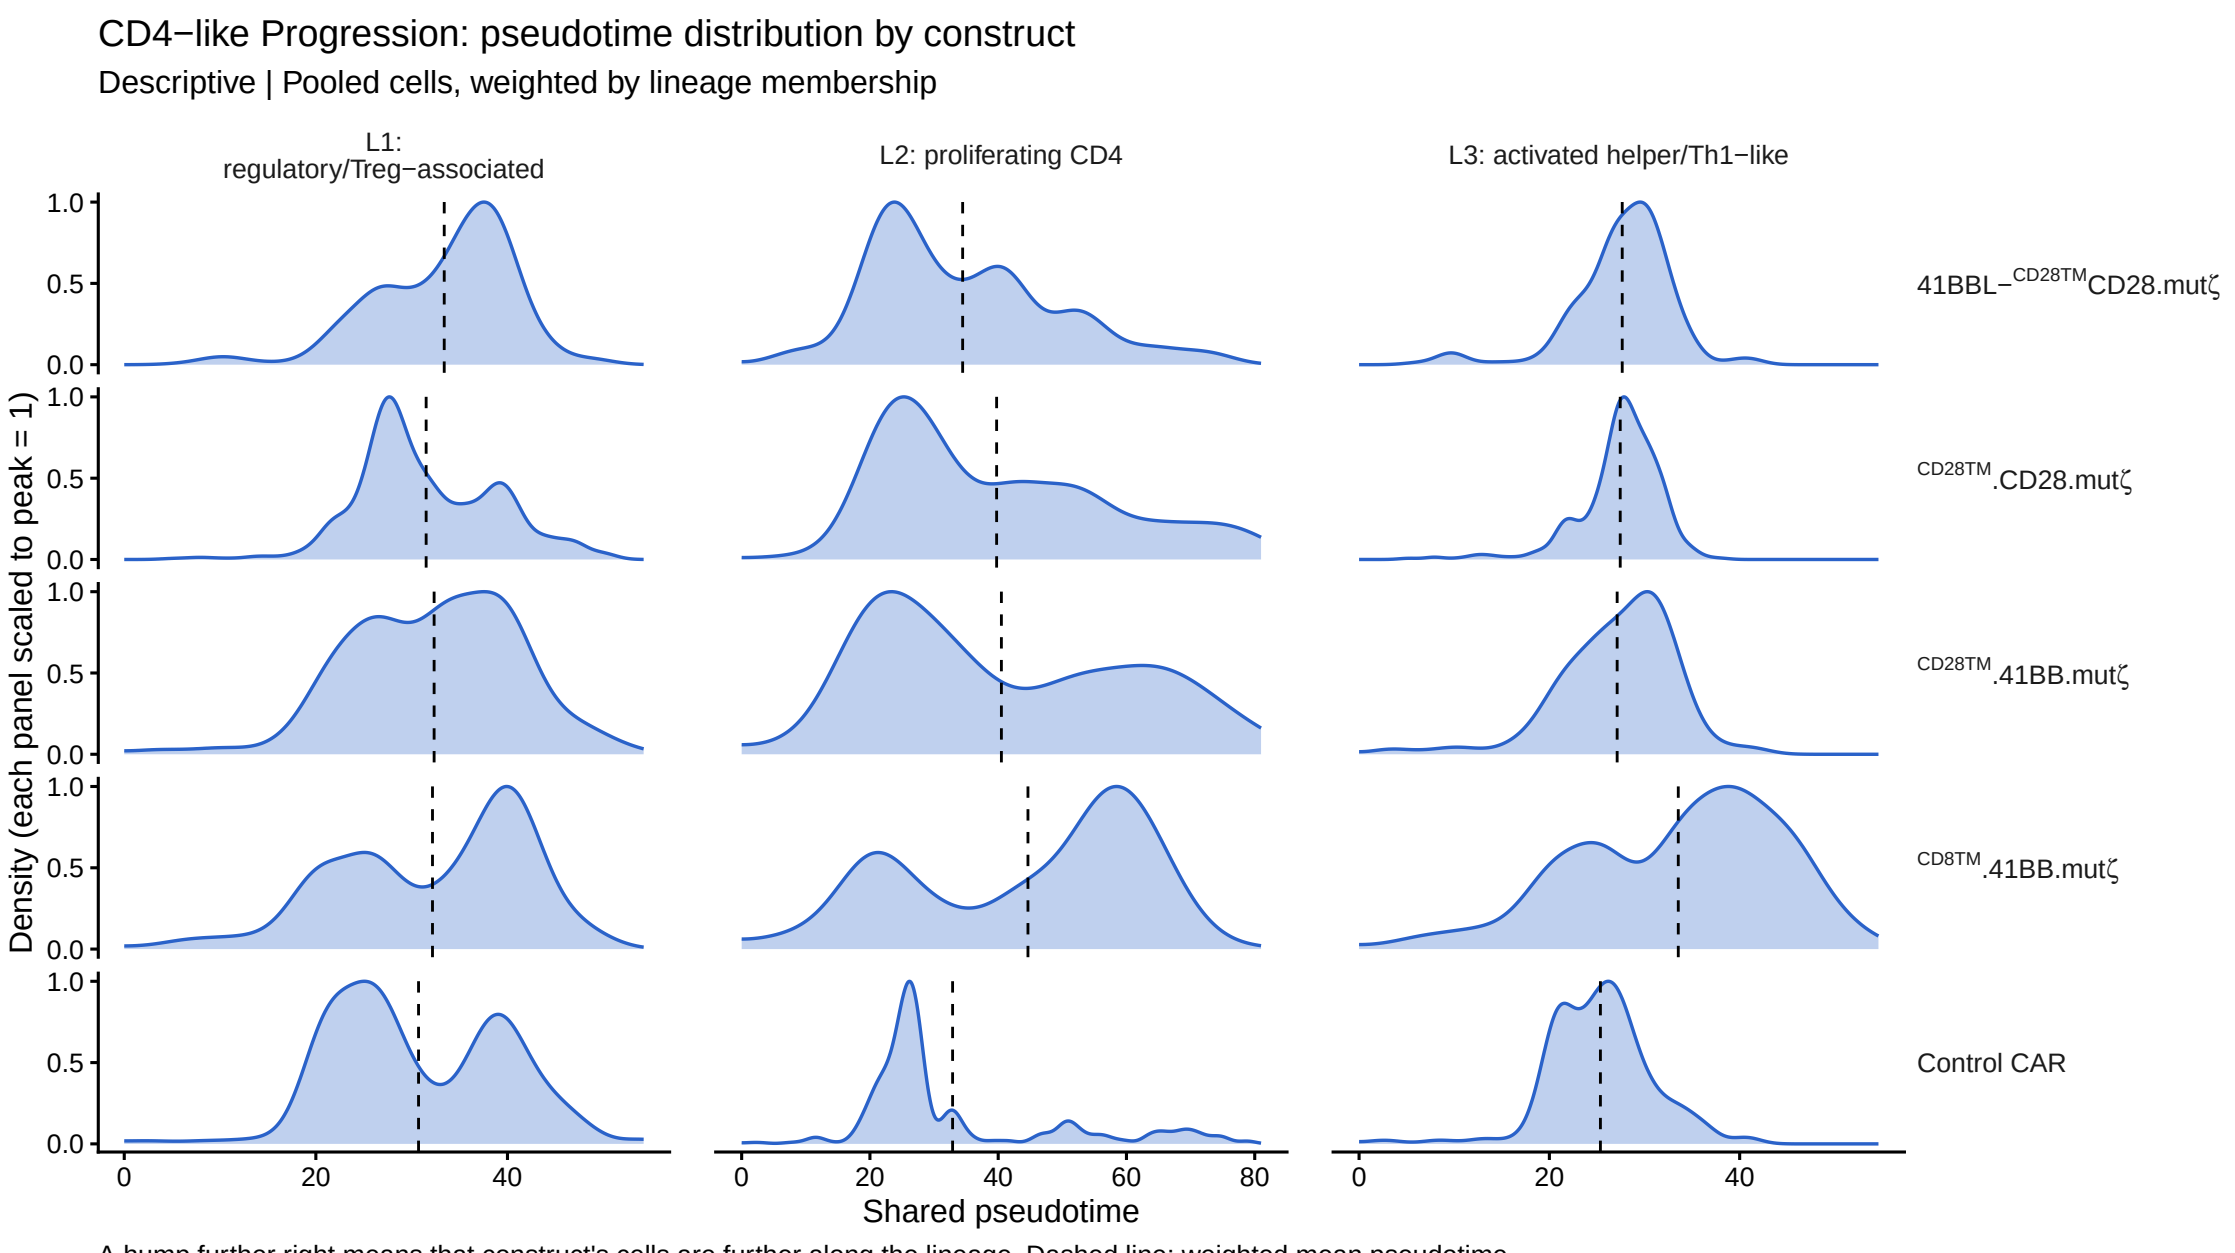

Focused comparison: B7H3_vs_41BB−L | Cell−level distributions and cached KS FDRs

Rightward = later shared pseudotime. Dashed lines and numbers: pooled cell−weighted means.
The KS test detects any distribution difference, not specifically 'later'.

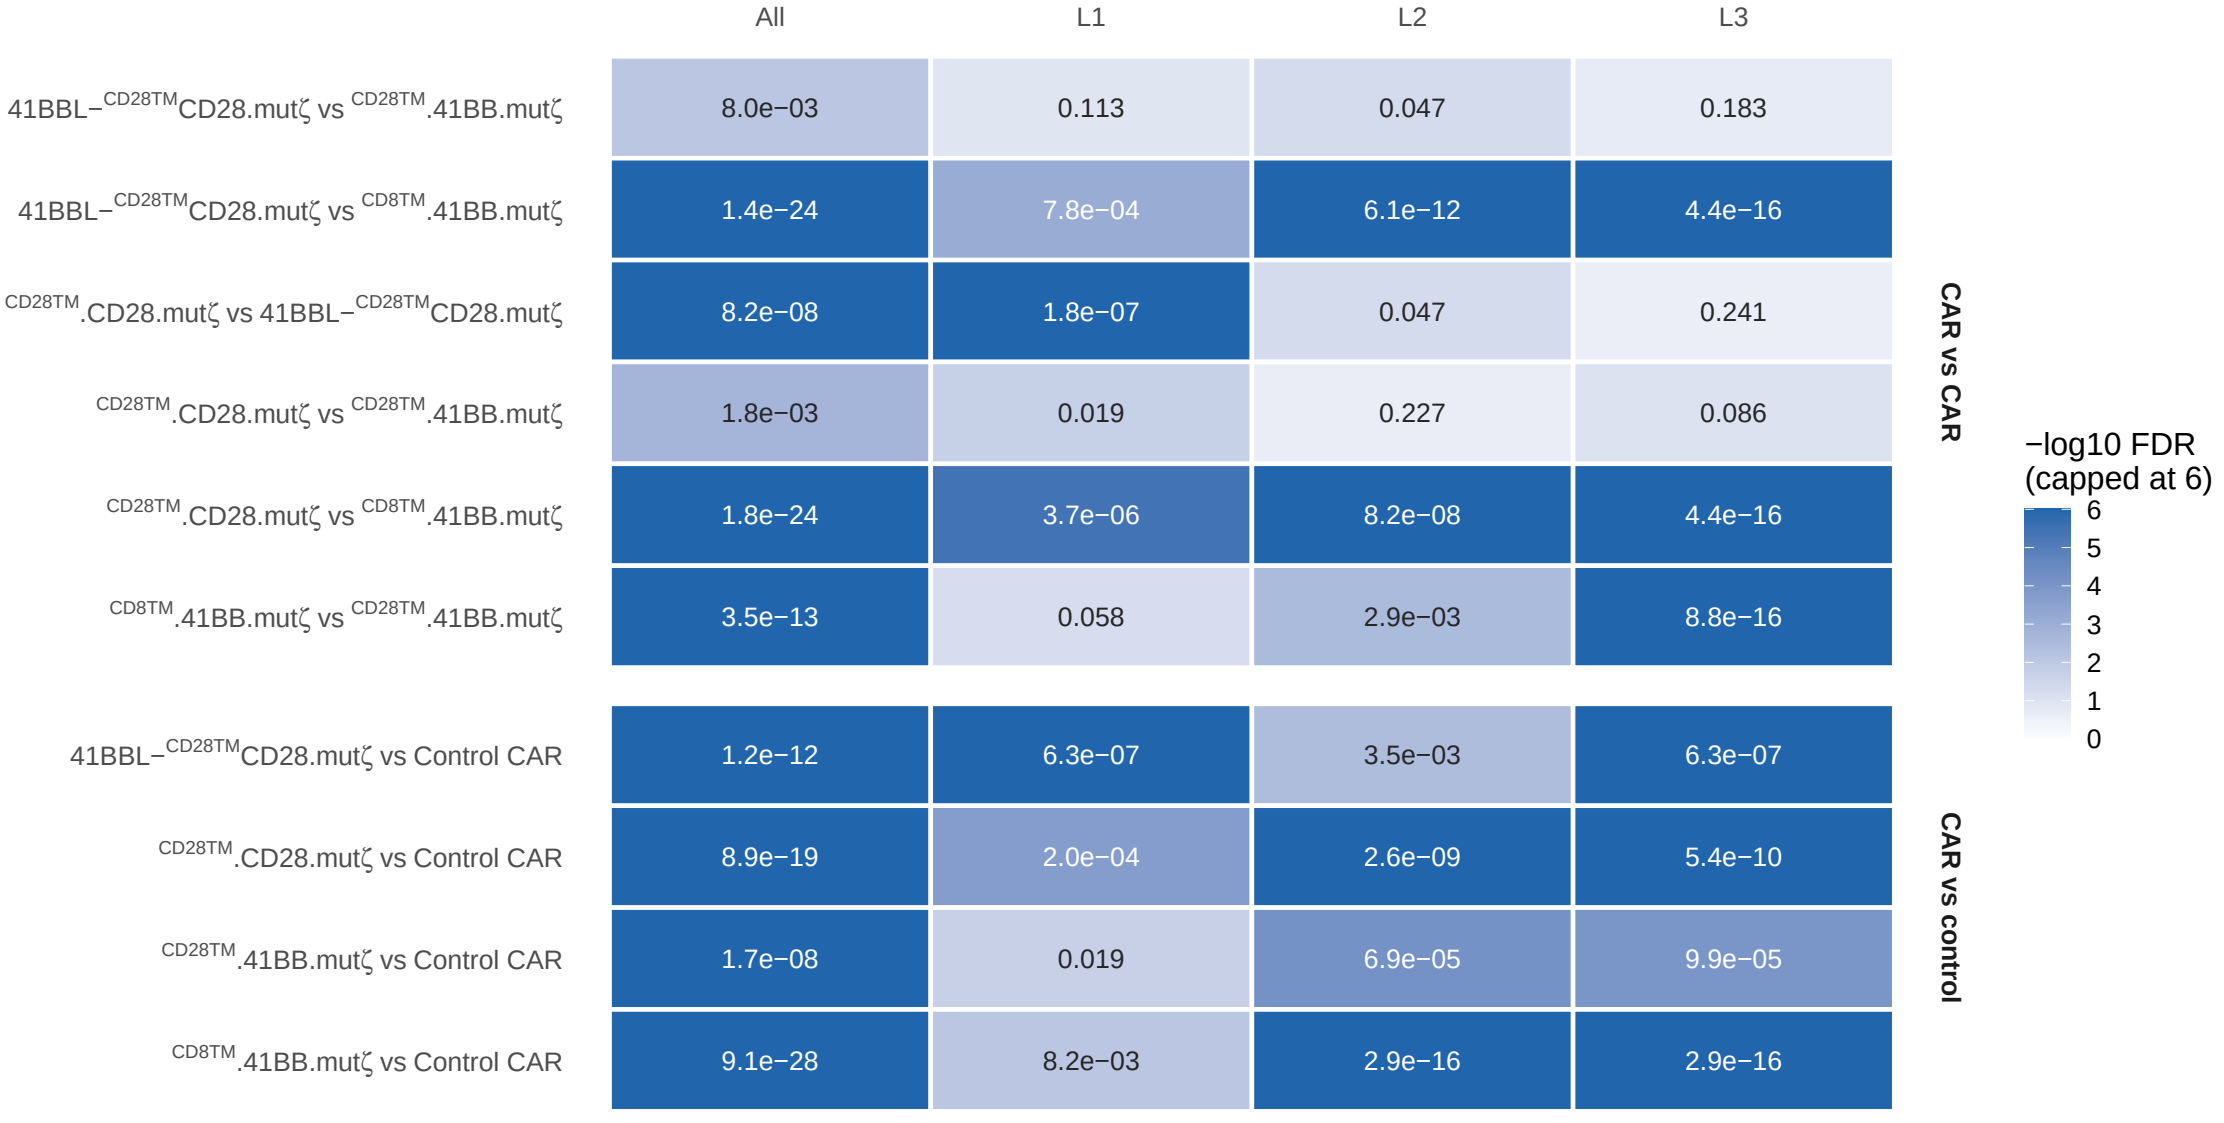

A curve further right (lower) means that construct's cells are further along the lineage.
A curve reaches 100% at that construct's latest cell. Curves that cross have no single direction.
KS FDRs for every pair are in the results TSV (adjusted within each comparison across its four tests).

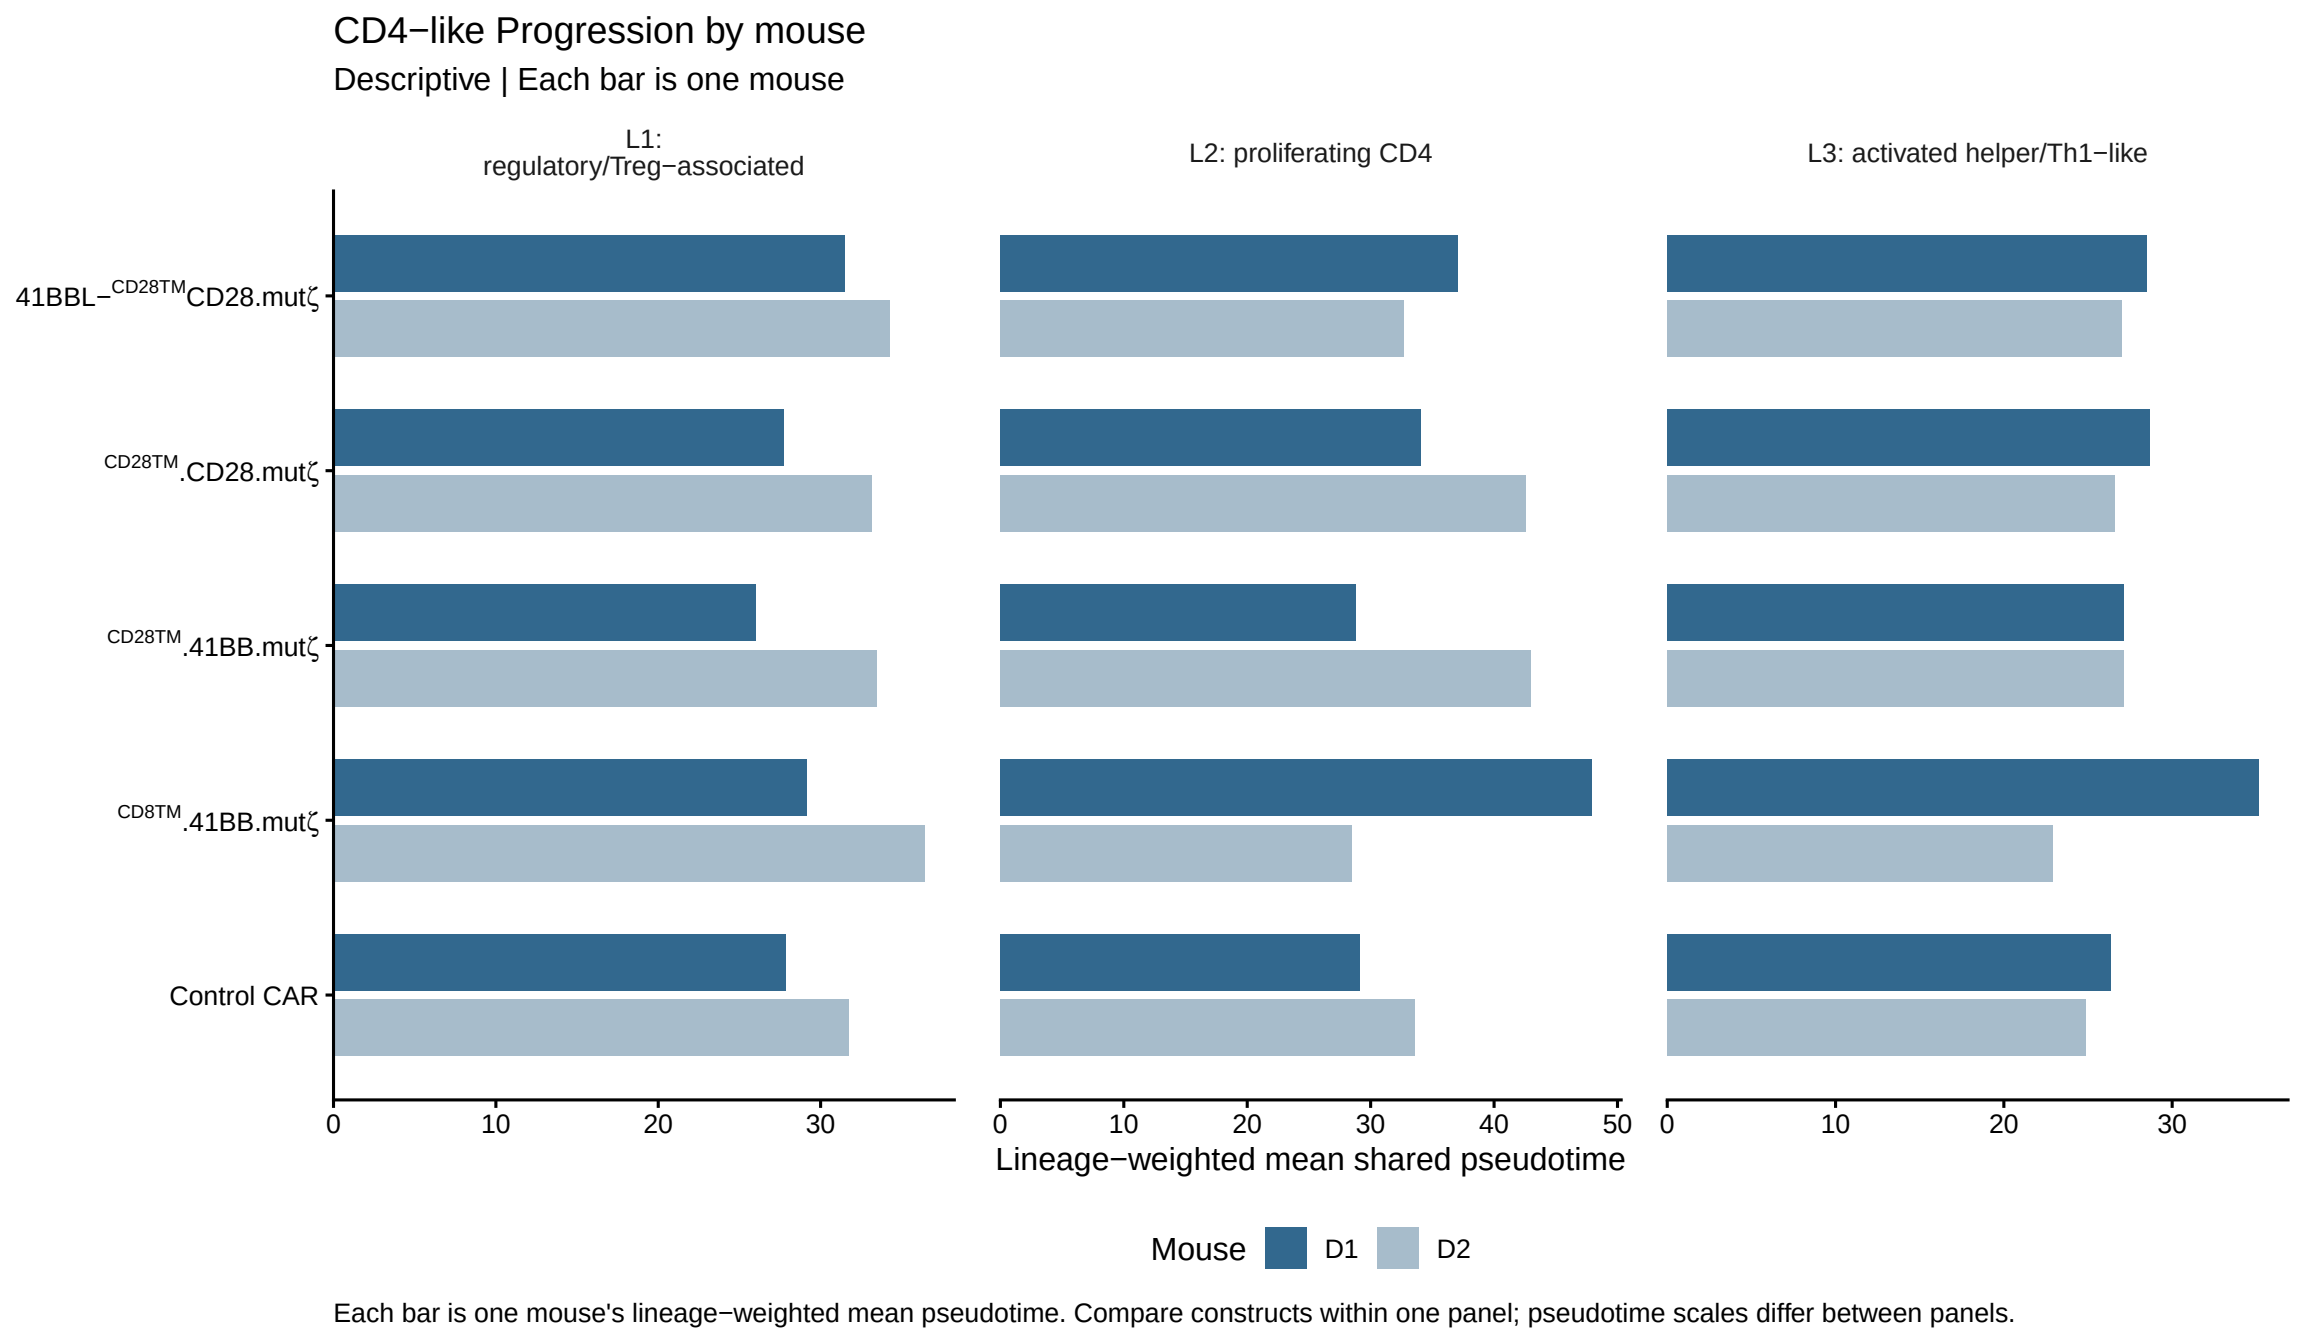

A hump further right means that construct's cells are further along the lineage. Dashed line: weighted mean pseudotime.
Each panel is scaled to a peak of 1: compare hump positions within a column, not heights. X−axes differ between lineages.

CD4−like Progression−test overview

Cell−level test | Two mice per construct

All = global test; L1−L3 = shared lineages. FDR is adjusted within each comparison across its four tests.
L1: regulatory/Treg−associated; L2: proliferating CD4; L3: activated helper/Th1−like

Each bar is one mouse's lineage−weighted mean pseudotime. Compare constructs within one panel; pseudotime scales differ between panels.
